

ABSTRACT OF THE DISCLOSURE

5 A telephone set and information terminal are connected
by a packet switched network. The information terminal has
a control target list in which a predetermined telephone
set is stored, and a first control means. The first
control means generates, based on an instruction from the
user (#201), a control command wherein an instruction
related to voice communication is recorded, and sends that
command to the predetermined telephone set (#202). The
10 telephone set has a terminal list wherein is stored a
predetermined information terminal, and a second control
means. The second control means generates (#204, 205),
based on a control command received from the predetermined
information terminal (#203), a call control command for
15 performing voice communication with another telephone set
on the packet switched network, and sends that command to
the other telephone set (#206).
